

among reptiles does not have many endemics within the Indian context because of the jagged political boundary of the country. Though restricted in their distribution in this region, locations of many reptiles are found outside India thereby making them Indian political non-endemics. The case is similar in northern and northwestern India with many species ranging across neighbouring countries such as Pakistan, Nepal, Afghanistan and Tibet. A graph depicting reptilian distribution is given in the main report.

One hundred and ten endemic taxa and 88 non-endemic reptiles are threatened according to the assessment at the workshop, based on the 1994 IUCN Red list categories. The high percentage of endemic taxa being threatened is due to restricted distribution of these taxa along with other man-induced threats to their wellbeing. Reptile are poorly studied group since information regarding distribution, population dynamics and threats are incomplete and most of the information available is from only a few well studied locations. Threats perceived to Indian reptiles are more physical in nature, such as those by habitat destruction, fragmentation, agricultural practices, pollution, pesticides and other kinds of human interference. Trade is also a contributing factor in threatening some reptile taxa in India.

Categorisation of taxa was done according to the 1994 IUCN Red List categories. For a taxon to be threatened, any one of the five criteria

within the categories has to be satisfied. These criteria or factors that are used in a categorisation of threat are 1. Population reduction; 2. Restricted distribution; 3. Population estimates; 4. Restricted population and 5 Probability of extinction. The degree of threat depending on each or any of these five criteria determines the threat category.

One of the major outcomes of this workshop was the post-assessment research and management recommendations for every reptile taxon. Participants identified lacunae areas that need prioritisation and this is indicated in the recommendation section. Survey and monitoring are the most frequently recommended research and management tools for understanding distribution and trends of reptile populations. The workshop was also an ideal forum to discuss controversial issues such as taxonomy and nomenclature of Indian reptiles. In the recent years, a few taxonomists have suggested frequent changes in generic names of some reptiles in India, which has led to confusion among field biologists. Unfortunately, due to lack of time, no special issue working groups could be convened to formally discuss the above controversies. However, it was felt that most of the biologists were happy to be able to discuss those issues within their working groups while assessing the status. It was also felt that a need for a network to identify and bring together reptile researchers in and around India required urgent action.

Table 1. Status of reptiles assessed at the workshop

Status	Endemic to India	Non-Endemic
Critically Endangered	16	16
Endangered	32	20
Vulnerable	62	52
Lower Risk -near threatened	37	68
Lower Risk - least concern	9	38
Data Deficient	41	59
Total Assessed	197	253
