Abstract

This paper provides a list of 189 meliolaceous fungi, infecting the host plants belonging to 72 families. These fungal taxa are distributed among the genera *Amazonia*, *Appendiculella*, *Asteridiella*, *Irenopsis* and *Meliola*. The species have been arranged alphabetically under their respective host families, which are also arranged alphabetically. The genus *Cryptomeliola* has been excluded from this group since it does not possess appressoria.

Keywords

Additions, black mildews, fungi, Meliolaceae

Introduction

The genus *Meliola* was proposed by Fries (1825). Later, Bornet (1851) emended the description. Gaillard (1892) was the first to monograph this genus. Stevens (1927, 1928) studied this group extensively. The monumental work of Hansford (1961) forms the base for the present work. Toro (1952) put forward arguments in support of his suggestion to treat *Meliola trichostroma* (Kunze) Toro as the type species of the genus and Hansford (1961) also agreed with it. However *Meliola psidii* has now been conserved and treated as the type species (Crane & Jones, 2001). Hansford (1963a,b) published supplements to his work with icons and dealt with nomenclatural aspects. Hosagoudar *et al.* (1997) gave an account of the species added to this group. The species added subsequently to this group till the middle of the year 2002 are listed in this supplement. This checklist provides all the published names of the species belonging to the genera *Amazonia*, *Appendiculella*, *Asteridiella*, *Irenopsis* and *Meliola* to facilitate as a ready reference work. The genus *Cryptomeliola* has been excluded from this group because it lacks appressoria (Mibey & Cannon, 1999).
